ACKNOWLEDGEMENT

*I wish to express my deep sense of gratitude and indebtedness to our learned teacher **Pankaj Bhilingwal**, PGT Computer Science, J.N.V Tarikhet Almora for his invaluable help, advice and guidance in the preparation of this project file.*

*I am also greatly indebted to our principal **D.S Rawat** and school authorities for providing me with the facilities and requisite laboratory conditions for making this project file.*

I also extend my thanks to a number of teachers, my classmates and friends who helped me to complete this project file successfully.

PREFACE

In the field of Computer Science, the term PROJECT refers to a Computerization Work that is completely performed by using a computer. Today when every field is going to be computerized means that all task of any field now a days done by using computer and their appropriate computer programs, then to do every field's different-different works, today different programs or software's are available in the form of Project.

Learning Python & MySQL in schools is a part of our syllabus, and according to the syllabus worked out by the CBSE, to which my school is affiliated, I enjoyed doing project work for the session 2026-27. I learned a lot, especially learning by doing was a great experience. The report is a summary of what I observed and learnt in school. My humble thanks are going to all the concerned related to my project.

I also feel that it is the right time to thank my teacher, who guided me during my project. I also feel that it is the right time to thank my parents, friends and my project partners for their constant assistance, cooperation extended by them time to time.

About Project

MySQL-based Student Management System

The MySQL-based Student Management System is a comprehensive solution for managing student records in an educational setting. Developed in Python and utilizing the MySQL database, this project provides a robust framework for administrators to efficiently handle various tasks related to student information.

Project Overview

Objective:

The primary goal of this Student Management System is to offer a scalable and organized approach to managing student records. Leveraging the power of MySQL for data storage and retrieval, the system ensures data integrity and provides a seamless user experience for administrators.

Key Features:

1. **Add Student:** Enables the addition of new student records with essential details like admission number, name, course, fees, and date of birth.
2. **Update Student:** Allows administrators to modify existing student information, ensuring accurate and up-to-date records.
3. **Delete Student:** Provides the capability to remove student records, maintaining a clean and relevant database.
4. **Search Student:** Facilitates quick and easy retrieval of student details based on their admission number.
5. **Display Students:** Presents a comprehensive list of all students enrolled, aiding in overall data visualization.

Technology Stack

Programming Language: Python
Modules Used: mysql.connector
Database Used: MySQL

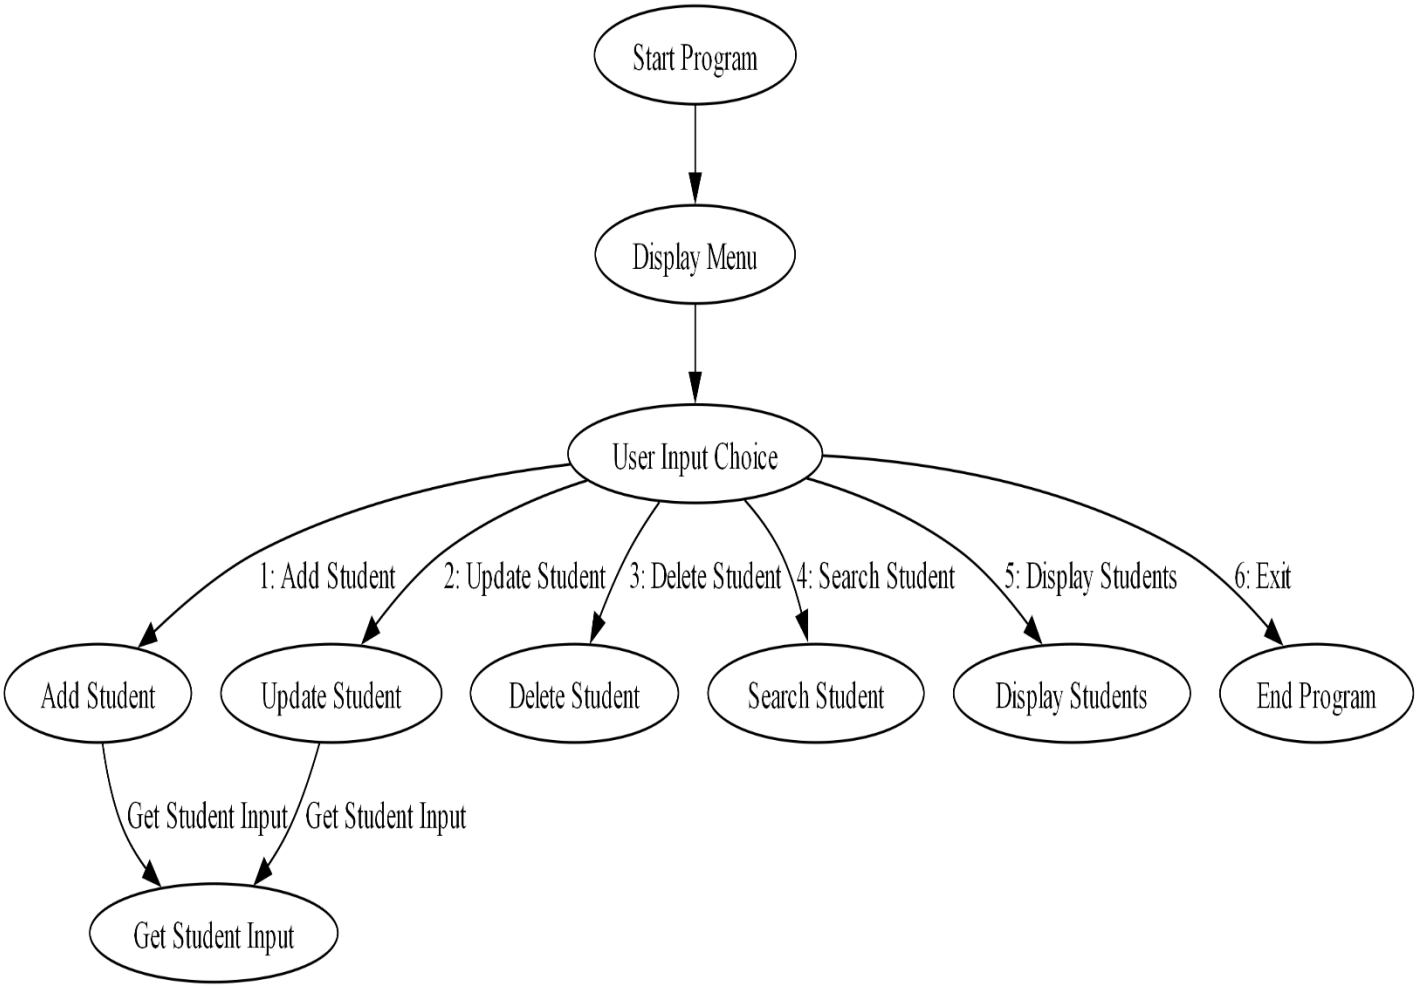

Description:

The project utilizes the mysql.connector module in Python to connect to the MySQL database. The MySQL database stores student records, and the Python scripts facilitate interactions with the database, such as adding, updating, deleting, searching, and displaying student information.

How to Run the Program

1. Ensure Python is installed on your system.
2. Install the mysql-connector module using pip install mysql-connector.
3. Set up a MySQL server locally or remotely and update the connection details in the Python script.
4. Execute the main program file, and a menu-driven interface will guide you through various operations.
5. This MySQL-based Student Management System simplifies administrative tasks, providing an efficient and organized solution for managing student records.
