ACKNOWLEDGEMENT

I wish to express my deep sense of gratitude and indebtedness to our learned teacher Pankaj Bhilingwal, PGT Computer Science, J.N.V Tarikhet Almora for his invaluable help, advice and guidance in the preparation of this project file.

I am also greatly indebted to our principal Pankaj Kumar Srivastava and school authorities for providing me with the facilities and requisite laboratory conditions for making this project file.

I also extend my thanks to a number of teachers, my classmates and friends who helped me to complete this project file successfully.

PREFACE

In the field of Computer Science, the term PROJECT refers to a computerization work that is completely performed by using a computer. Today almost every field is computerized, and the different tasks of every field are done using computers and appropriate computer programs. Such programs and software are developed in the form of Projects.

Learning Python in schools is a part of our syllabus, and according to the syllabus worked out by the CBSE, to which my school is affiliated, I enjoyed doing project work for the session 2026-27. I learned a lot, especially learning by doing was a great experience. The report is a summary of what I observed and learnt in school. My humble thanks go to all those concerned with my project.

I also feel that it is the right time to thank my teacher, who guided me during my project, and my parents, friends and project partners for the constant assistance and cooperation extended by them from time to time.

About Project

Hospital Management System Using Python and MySQL

The Hospital Management System is a menu-driven program developed in Python with MySQL as the back-end database. It helps the reception desk of a hospital to keep the records of doctors and patients and to manage appointments.

The data is stored in three related tables - doctors, patients and appointments. The program connects Python with MySQL using the mysql.connector module and performs all common SQL operations: creating tables, inserting, searching, updating, joining tables and generating reports with aggregate functions.

Project Overview

Objective:

The objective of this project is to learn how a Python program works with a relational database. It replaces paper registers at a hospital reception with a computerized system that is fast, accurate and gives useful reports like the number of appointments per department and fees collected by each doctor.

Key Features:

1. **Add / Show Doctors:** Add a new doctor and view doctors of all departments or of one department.
2. **Register Patient:** Store patient ID, name, age, gender and phone number.
3. **Search Patient:** Search patients by full or partial name using the LIKE operator.
4. **Book Appointment:** Book an appointment of a patient with a doctor on a date.
5. **Cancel Appointment:** Change the status of an appointment to 'Cancelled' using UPDATE.
6. **Show All Appointments:** Display appointments with patient name, doctor name and department by joining three tables.
7. **Reports:** Appointments per department, fees collected by each doctor, and patient age statistics using GROUP BY, COUNT, SUM, MIN, MAX and AVG.
8. **Error Handling:** Shows a proper message for wrong input or database errors (e.g. duplicate patient ID).

Technology Stack

Programming Language: Python 3

Database: MySQL

Modules Used: mysql.connector

mysql.connector.connect() creates the connection, cursor() gives a cursor object, execute() runs SQL queries, fetchone() and fetchall() read the results, commit() saves changes and rowcount tells how many rows were changed. All values are passed to queries with %s placeholders, which is the safe and correct way of sending user input to MySQL.

Files in this Project

File	Purpose
hospital.py	Main program (menu, database connection and queries)

hospital_sample_data.sql	SQL script to create the database with sample records
flowchart.py	Python program that draws the flowchart using graphviz
flowchart.png	Flowchart image
img/	Screenshots of the output

How to Run the Program

1. Install Python 3 and MySQL Server.
2. Install the connector module: pip install mysql-connector-python
3. Open hospital.py and change PASSWORD = "admin" to your MySQL root password.
4. Run hospital.py. The database, tables and five doctors are created automatically on the first run.
5. (Optional) To load sample patients and appointments, run in MySQL: SOURCE hospital_sample_data.sql;

Syllabus Concepts Used

This project covers the following topics of the CBSE Class XII Computer Science (083) syllabus:

Concept	Where it is used in the project
Python-MySQL connectivity	connect(), cursor(), execute(), executemany(), commit(), close()
Fetching results	fetchone() for COUNT(*), fetchall() for lists of records, rowcount, lastrowid
DDL commands	CREATE DATABASE, CREATE TABLE with PRIMARY KEY, NOT NULL, DEFAULT, AUTO_INCREMENT, FOREIGN KEY
DML commands	INSERT (add doctor/patient/appointment), UPDATE (cancel appointment)
SELECT with clauses	WHERE, LIKE, ORDER BY, GROUP BY
Aggregate functions	COUNT(), SUM(), MIN(), MAX(), AVG() in reports()
Joins	Equi-join of appointments, patients and doctors tables
Parameterized queries	Values passed with %s placeholders, e.g. WHERE name LIKE %s
Exception handling	try-except for ValueError and mysql.connector.Error

Database Design

Database name: hospital. The program creates the database and the following three tables automatically.

Table: doctors

Stores details of doctors.

Column	Data Type	Constraint / Description
doc_id	INT	PRIMARY KEY
name	VARCHAR(40)	NOT NULL
department	VARCHAR(30)	Department of the doctor
fees	INT	Consultation fees

Table: patients

Stores details of registered patients.

Column	Data Type	Constraint / Description
pat_id	INT	PRIMARY KEY
name	VARCHAR(40)	NOT NULL
age	INT	Age of patient
gender	CHAR(1)	M / F
phone	VARCHAR(10)	Mobile number

Table: appointments

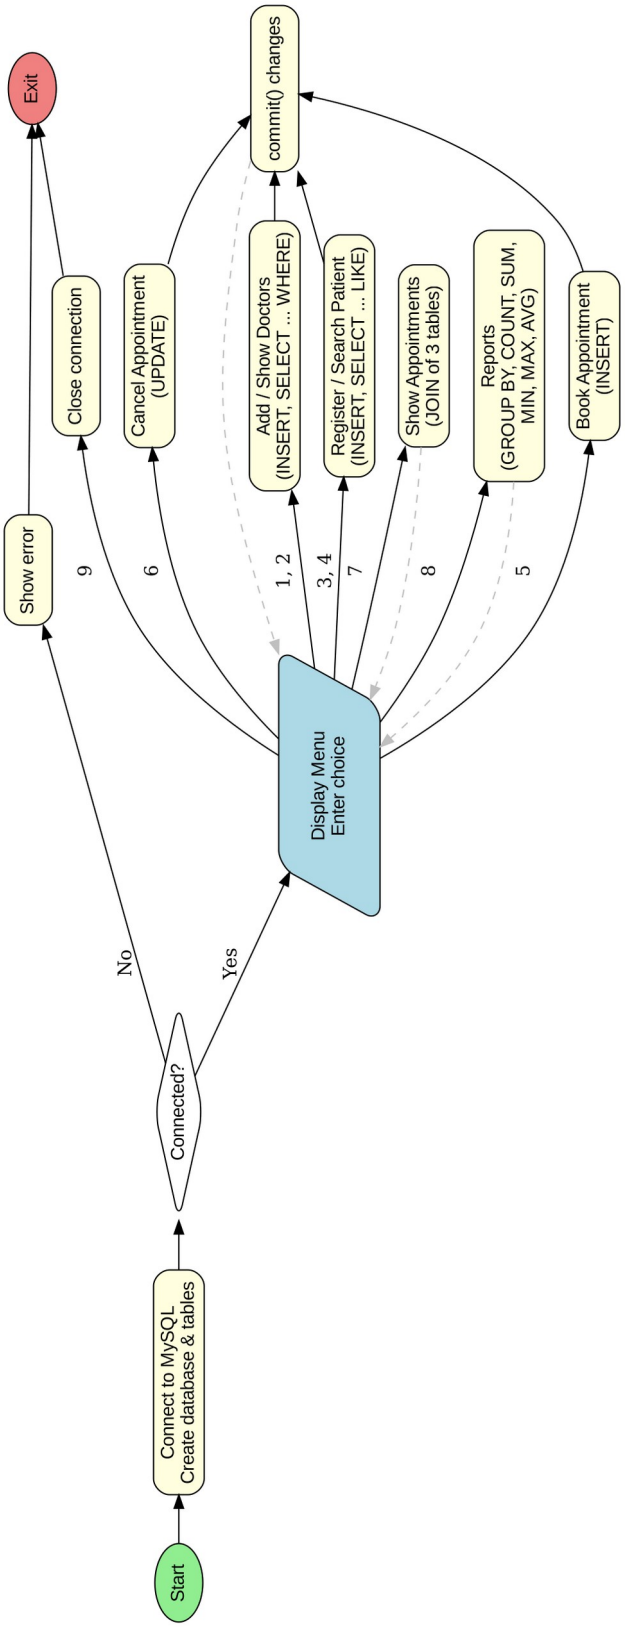

Stores which patient meets which doctor on which date.

Column	Data Type	Constraint / Description
app_id	INT	PRIMARY KEY, AUTO_INCREMENT
pat_id	INT	FOREIGN KEY references patients(pat_id)
doc_id	INT	FOREIGN KEY references doctors(doc_id)
app_date	DATE	Date of appointment
status	VARCHAR(10)	Booked / Cancelled (DEFAULT 'Booked')

Relationship between Tables

The appointments table connects the other two tables. Its pat_id column is a foreign key referring to patients and its doc_id column is a foreign key referring to doctors. So one patient can have many appointments and one doctor can have many appointments. To show patient and doctor names together, the program joins the three tables using the condition a.pat_id = p.pat_id AND a.doc_id = d.doc_id.
