ACKNOWLEDGEMENT

I wish to express my deep sense of gratitude and indebtedness to our learned teacher Pankaj Bhilingwal, PGT Computer Science, J.N.V Tarikhet Almora for his invaluable help, advice and guidance in the preparation of this project file.

I am also greatly indebted to our principal Pankaj Kumar Srivastava and school authorities for providing me with the facilities and requisite laboratory conditions for making this project file.

I also extend my thanks to a number of teachers, my classmates and friends who helped me to complete this project file successfully.

PREFACE

In the field of Computer Science, the term PROJECT refers to a computerization work that is completely performed by using a computer. Today almost every field is computerized, and the different tasks of every field are done using computers and appropriate computer programs. Such programs and software are developed in the form of Projects.

Learning Python in schools is a part of our syllabus, and according to the syllabus worked out by the CBSE, to which my school is affiliated, I enjoyed doing project work for the session 2026-27. I learned a lot, especially learning by doing was a great experience. The report is a summary of what I observed and learnt in school. My humble thanks go to all those concerned with my project.

I also feel that it is the right time to thank my teacher, who guided me during my project, and my parents, friends and project partners for the constant assistance and cooperation extended by them from time to time.

About Project

Bank Account Management System Using Binary File

The Bank Account Management System is a menu-driven Python program that works like a small bank. It can open new accounts, deposit and withdraw money, transfer money between accounts and show the balance of any account.

Account records are stored as dictionaries in a binary file (accounts.dat) using the pickle module. The program uses exception handling so that wrong inputs, missing accounts or low balance never crash the program. It also has an UNDO feature that reverses the last transaction using a stack.

Project Overview

Objective:

The objective of this project is to practise binary file handling and exception handling together in a real-life application, and to show how a stack can be used to provide an Undo facility, as seen in many software applications.

Key Features:

1. **Create Account:** Opens a new Saving or Current account with an automatically generated account number (1001, 1002, ...). Minimum opening amount is Rs. 500.
2. **Deposit Money:** Adds money to an account and saves the updated balance in the file.
3. **Withdraw Money:** Withdraws money only if a minimum balance of Rs. 500 remains.
4. **Transfer Money:** Moves money from one account to another account.
5. **Balance Enquiry:** Shows the details and balance of one account.
6. **Display All Accounts:** Shows all accounts in a neat table.
7. **Undo Last Transaction:** Reverses the latest deposit, withdrawal or transfer using a stack (LIFO).
8. **Error Handling:** Handles wrong input, account not found and insufficient balance with clear messages.

Technology Stack

Programming Language: Python 3

Modules Used: pickle

Each account is a dictionary {acc_no, name, type, balance}. New records are added with pickle.dump() in append mode ('ab'). To read all records, pickle.load() is called in a loop until EOFError is raised. To update a record, all records are read into a list, changed, and written back with mode 'wb'. A list named transactions works as a stack for the Undo feature.

Files in this Project

File	Purpose
bank.py	Main program
accounts.dat	Binary file storing the account records (created automatically)
flowchart.py	Python program that draws the flowchart using graphviz

flowchart.png	Flowchart image
img/	Screenshots of the output

How to Run the Program

1. Make sure Python 3 is installed on the computer.
2. Copy the project folder to the computer.
3. Open bank.py in IDLE and press F5 (or run: python bank.py).
4. Delete accounts.dat if you want to start with no accounts.

Syllabus Concepts Used

This project covers the following topics of the CBSE Class XII Computer Science (083) syllabus:

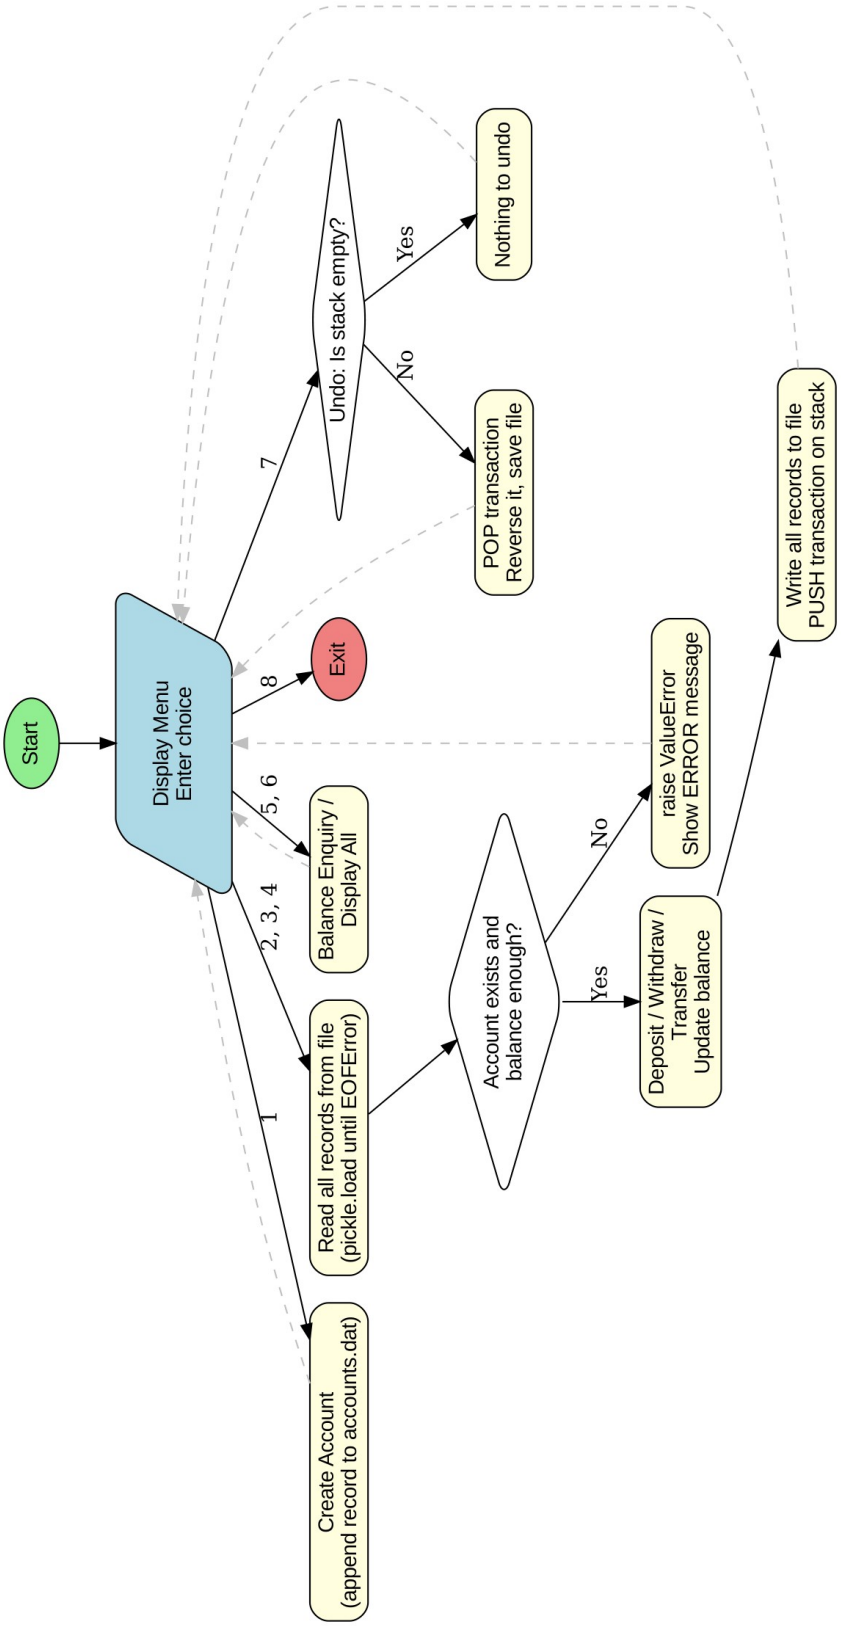

Concept	Where it is used in the project
Binary file handling	pickle.dump() and pickle.load(); file modes 'rb', 'wb' and 'ab'
Reading till end of file	while True loop with pickle.load() stopped by EOFError
Exception handling	try, except ValueError, except FileNotFoundError, except EOFError, finally
Raising exceptions	raise ValueError(...) for invalid account and insufficient balance
Stack	List transactions: append() to PUSH, pop() to POP in undo_last()
Dictionaries	Each account record is a dictionary
User-defined functions	Separate function for each operation, helper functions get_number() and get_account()
Global variables	transactions, FILE_NAME and MIN_BALANCE are used by many functions
String formatting	% formatting to print the accounts table

Why exception handling?

An exception is an error that occurs while the program is running, for example entering 'abc' where a number is expected (ValueError) or opening a file that does not exist (FileNotFoundError). Without handling, the program stops suddenly.

With try-except blocks the program catches the error and shows a friendly message instead. The finally block always runs, so it is used to close the file. The raise statement lets us create our own error, e.g. when the balance is not enough.

Flow Chart

Start
Display Menu
Enter choice
1
Create Account
(append record to accounts.dat)
2, 3, 4
Read all records from file
(pickle.load until EOFError)
Account exists and
balance enough?
No
raise ValueError
Show ERROR message
Yes
Deposit / Withdraw /
Transfer
Update balance
Write all records to file
PUSH transaction on stack
5, 6
Balance Enquiry /
Display All
7
Undo: Is stack empty?
Yes
Nothing to undo
No
POP transaction
Reverse it, save file
8
Exit

Project Code

```
# Bank Account Management System
# Uses: Binary file (pickle), Exception handling, Stack (for UNDO)

import pickle
