ACKNOWLEDGEMENT

*I wish to express my deep sense of gratitude and indebtedness to our learned teacher **Pankaj Bhilingwal**, PGT Computer Science, J.N.V Tarikhet Almora for his invaluable help, advice and guidance in the preparation of this project file.*

*I am also greatly indebted to our principal **Pankaj Kumar Srivastava** and school authorities for providing me with the facilities and requisite laboratory conditions for making this project file.*

I also extend my thanks to a number of teachers, my classmates and friends who helped me to complete this project file successfully.

PREFACE

*This project report details the development of a **Library Management System** using Python. The project is designed to automate the management of a school library, allowing the librarian to perform operations such as adding books, registering students, issuing and returning books, and tracking each student's issued and returned books. The project highlights Python's powerful data-handling capabilities, especially using the Pickle module for data persistence. The project aims to simplify and improve the efficiency of library operations.*

I also feel that it is the right time to thank my teacher, who guided me during my project. I also feel that it is the right time to thank my parents, friends and my project partners for their constant assistance, cooperation extended by them time to time.

About Project

Introduction:

The Library Management System is a Python-based project designed to automate library operations. This system allows the librarian to add and remove books, register students, issue books, and manage book returns. The system also tracks how many books a student has issued or returned. Data is saved using Python's Pickle module, ensuring the information persists between program runs.

Programming Language:

The project is implemented using the Python programming language, known for its simplicity and versatility. Python's ease of use makes it an ideal choice for developing interactive and enjoyable games.

Modules Used:

1. Pickle Module: To store and load library and student data.
2. UUID Module: To generate unique IDs for students.
3. OS Module: To handle file operations.

How to Run the Program:

1. Open the terminal or command prompt.
2. Navigate to the directory where the Python script is saved.
3. Run the script using the command:
   python library_management_system.py

The system will prompt the user for librarian authentication before allowing any operations.

System Features

1. Librarian Authentication

Only the librarian with a valid username and password can access the system.

2. Student Registration

Students are registered with their name, roll number, class, section, gender, and date of birth. Each student is assigned a unique student ID.

3. Book Management

Books can be added and removed by the librarian.

4. Book Issuing and Returning

Registered students can issue books. The system ensures that:

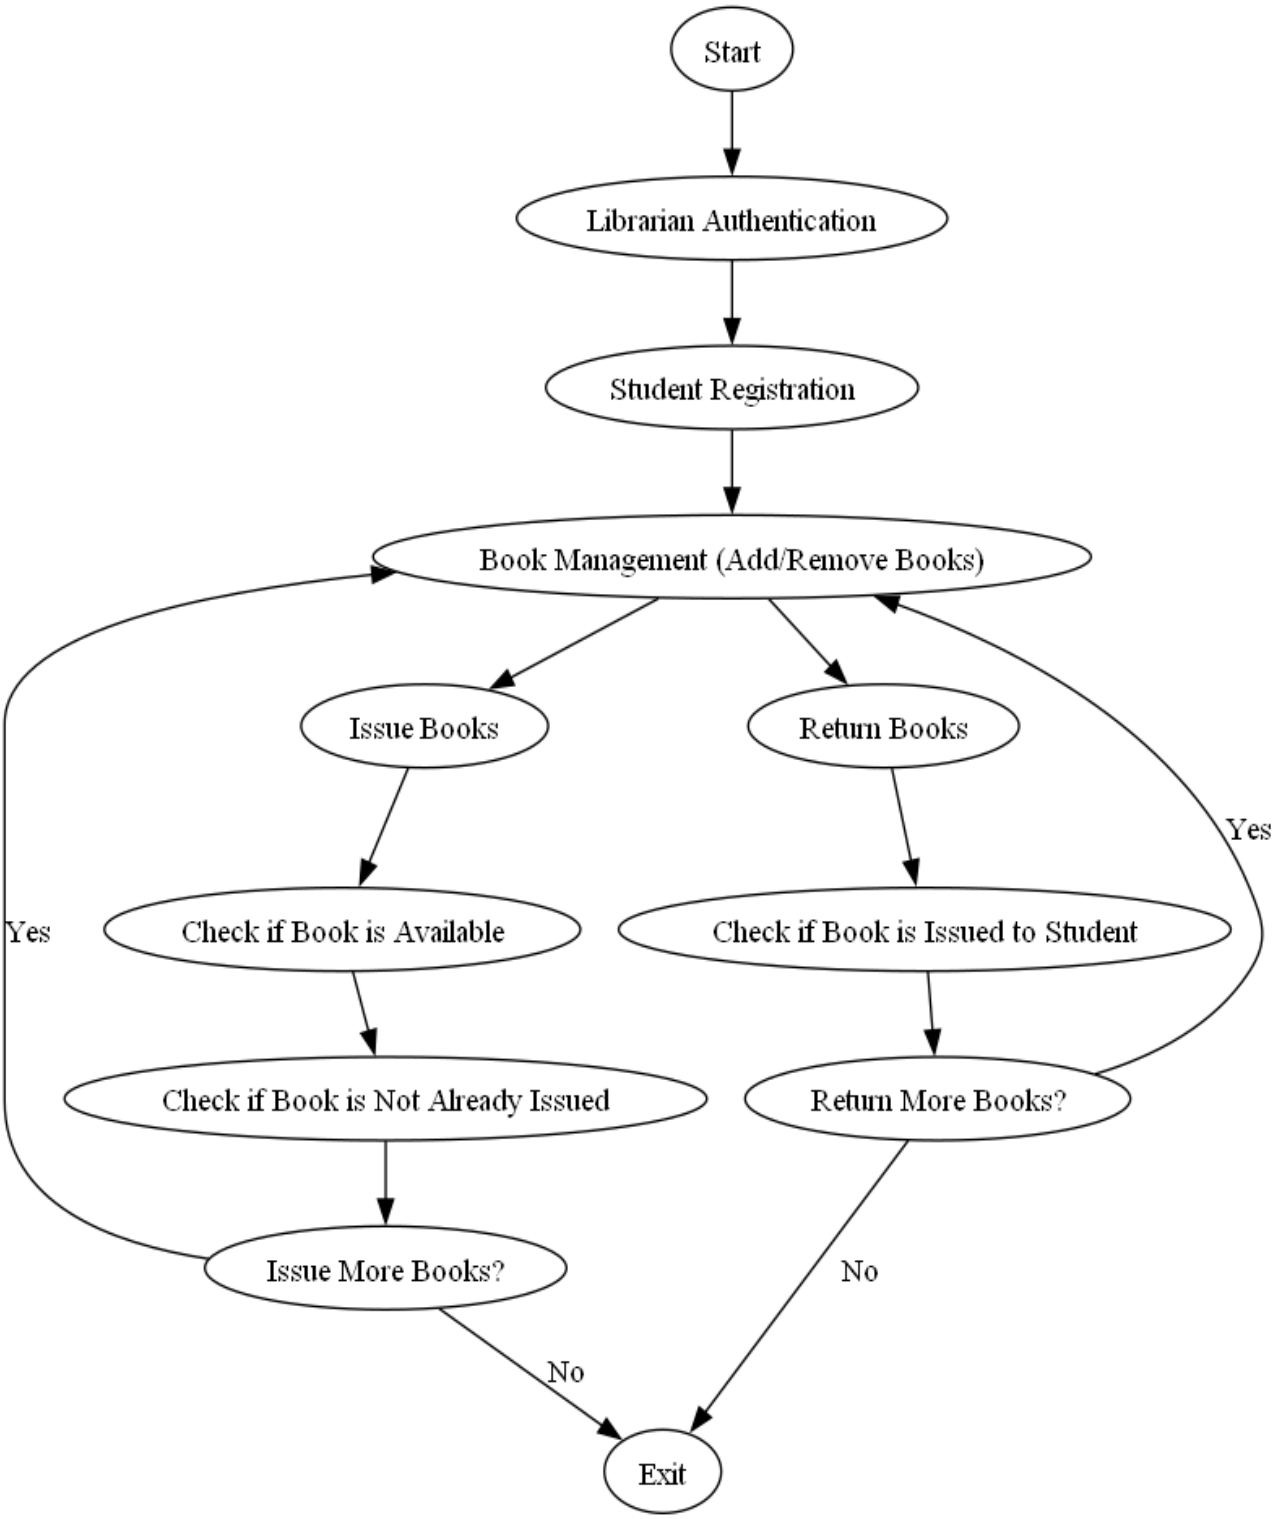

- A student can issue a maximum of 10 books at a time.
- The same book cannot be issued twice unless it is returned.
- Only books available in the library can be issued. After issuing a book, the system prompts if the student wants to issue another book.

5. **Tracking Issued and Returned Book**
   The system tracks the number of books issued and returned by each student.

User Interaction:

1. **Librarian Login:**
   The librarian needs to authenticate with a username and password to access the system.
2. **Menu Options:**
   The system displays a menu with options such as registering students, adding books, issuing books, etc.
3. **Student Registration:**
   The librarian enters the student's details, and the system generates a unique student ID.
4. **Book Issuing:**
   The librarian enters the student ID and book ID. The system checks if the book is available and issues it to the student.
5. **Book Return:**
   The librarian enters the student ID and book ID to return the book.
